An aircraft includes a passenger cabin, a plurality of settable cabin environment systems, and an aircraft environment management system. The passenger cabin has an environment. The plurality of settable cabin environment systems are in operable communication with the passenger cabin and each control an aspect of the environment based on a setting. The aircraft environment management system is in electronic communication with the plurality of settable cabin environment systems and is programmed to: receive a preset capture request from a user; store, as an environment preset, the setting as it existed for each of the plurality of settable cabin environment systems at a time of receipt of the preset capture request; receive a preset recall request for the environment preset; and recall the environment preset by adjusting the setting of each of the plurality of settable cabin environment systems according to the environment preset.
